

Points of discussion regarding the improvements of the tool

Outcomes are now derived:

Spatial effort:

'fishing_tech', 'gear_type', 'target_assemblage', 'metier','vessel_length',

Spatial landings:

'fishing_tech', 'gear_type', 'target_assemblage', 'metier','vessel_length', 'species'

Would be useful to add more fields?

Aggregate this outcome e.g. by 'gear_type','vessel_length'?

In the MCDA approach we use as input criteria:

- depth
- distance to coast
- chlorophyll-a (quarter)
- fishing effort from OTB (quarter)
- fishing effort from PS (quarter)
- No take zones (boolean value)

Would be useful to modify or add more criteria?

Weather conditions (availability ?)
